Description

Toika fold out bed TK331 is designed for afternoon naps for kindergarten use. There are two beds for children who's maximum height is 140 cm. Gas springs make raising and lowering the bed easier. The ladder that rises with the bed conveniently forms a safety rail at the head of the upper bed when in the elevated position. The upper bed features safety rails on the sides, while the lower bed includes guard rails. An automatic safety lock is engaged when the beds are in the elevated position. The cabinet bed model TK331 complies with the safety requirements of the SFS-EN 1129-1 standard.

Cabinet dimensions (W x D x H): 700 x 400 (+ door) x 2318 mm

Mattress dimensions (L x W x H): 1400 x 550 x 50 mm

Mounting heights are 761 mm and 2273 mm from the floor.

Materials

The cabinet frame and door are made of melamine or high-pressure laminate. The beds are made of lacquered northern birch, and the bed bases are perforated birch plywood.

Ladder that works as a safety rail

The bed ladder easily converts into a safety rail at the foot of the upper bed, while still allowing access to the lower bed.

Curtain for the lower bed

An optional fully blackout curtain with tracks is available for the lower bed. This allows the child to create a calm, private nook when the door is positioned on the other side.

Color options: Gray, white-gray, dark brown, green, terra, and yellow.

Ventilated structure

The bed bases and the cabinet floor are perforated to ensure proper air circulation within the cabinet, keeping the bedding fresh and comfortable to use.

Easy to clean

The plinth is flush with the cabinet sides, significantly simplifying cleaning. Additionally, the cabinet floor is elevated, preventing debris from entering the cabin.

Adjustable legs

The frame is equipped with easily adjustable legs that provide versatile leveling options. These adjustable legs allow the cabinets to be installed on sloped floors and prevent moisture on the floor from transferring to the frame.

Gas springs

The beds are raised and lowered with dampened gas springs, ensuring safe and ergonomic use.

Anti-slam mechanism

The anti-slam device automatically locks the door to the edge of the bed, when the door is open. The lock releases automatically when the end handle is lifted.

Horizontally aligned steps

The bed features three horizontally aligned steps, providing a comfortable surface for climbing into the bed.

Door safety lock

The door automatically locks when closed, ensuring that children cannot open it.

Locking latch

An easy-to-use locking latch keeps the bed securely inside the cabinet.

250-degree hinges

Hinges that open up to 250 degrees ensure ease of use and long-lasting durability.
